November 3, 2021

1 Dataset 1 - Regression

1.1 Experiment Details

The aim of the experiment is to verify if the: 1. ABC_GAN model corrects model misspecification
2. ABC_GAN model performs better and converges faster than a simple C-GAN model

In the experiment we predict the distribution that represents the real data and simulate realistic fake data points using statistical model, C-GAN and ABC-GAN model with 3 priors. We analyze and compare their performance using metrics like mean squared error, mean absolute error, manhattan distance and euclidean distance between y_{real} and y_{pred}

The models are as follows:

1. The statistical model assumes the distribution $Y = \beta X + \mu$ where $\mu \sim N(0, 1)$
2. The Conditional GAN consists of
 1. Generator with 2 hidden layers with 100 nodes each and ReLu activation.
 2. Discriminator with 2 hidden layers with 25 and 50 nodes and ReLu activation. We use Adam's optimiser and BCE Logit Loss to train the model. The input to the Generator of the GAN is (x,e) where x are the features and $e \sim N(0, 1)$. The discriminator output is linear.
3. The ABC GAN Model consists of
 1. ABC generator is defined as follows:
 1. $Y = 1 + \beta_1 x_1 + \beta_2 x_2 + \beta_3 x_3 + \dots + \beta_n x_n + N(0, \sigma)$ where $\sigma = 0.1$
 2. $\beta_i \sim N(0, \sigma^*)$ when $\mu = 0$ else $\beta_i \sim N(\beta_i^*, \sigma^*)$ where β_i^* s are coefficients obtained from statistical model
 3. σ^* takes the values 0.01, 0.1 and 1
 2. C-GAN network is as defined above. However the input to the Generator of the GAN is (x, y_{abc}) where y_{abc} is the output of the ABC Generator.

1.2 Import Libraries

```
[1]: import warnings
import sys
sys.path.insert(0, '../src')
warnings.filterwarnings('ignore')
```

```
[2]: import train_test
import ABC_train_test
import bostonDataset
import network
import statsModel
import performanceMetrics
import dataset
import sanityChecks
import torch
import matplotlib.pyplot as plt
import seaborn as sns
from scipy.stats import norm
from torch.utils.data import Dataset, DataLoader
from torch import nn
```

1.3 Parameters

General Parameters

1. Number of Samples
2. Number of features

ABC-Generator parameters are as mentioned below: 1. mean : 1 ($\beta \sim N(\beta^*, \sigma)$ where β^* are coefficients of statistical model) or 1 ($\beta \sim N(0, \sigma)$) 2. std : $\sigma = 1, 0.1, 0.01$ (standard deviation)

```
[3]: n_features = 13
n_samples= 506

#ABC Generator Parameters
mean = 1
variance = 0.001
```

```
[4]: # Parameters
mean = 0
variance = 0.1
```

1.4 Dataset

Generate a random regression problem

$Y = 1 + \beta_1 x_1 + \beta_2 x_2 + \beta_3 x_3 + \dots + \beta_n x_n + N(0, \sigma)$ where $\sigma = 0.1$

```
[5]: X,Y = bostonDataset.boston_data()
```
